Current version: OCR4all 0.6.1.

With the release of OCR4all 0.5.0 in November 2020, in addition to being set up via Docker, the software now also offers the option of installing via **VirtualBox** , which is particularly recommended for non-technical users. In addition, there are numerous innovations such as the processing of grayscale images in LAREX, a collection of preconfigured virtual keyboards for different languages, the generation of structural data of the word level during text recognition and their integration into the corresponding PageXML files, as well as expanded selection options for text result generation. Further bug fixes and improvements are the corresponding release notes of **OCR4all** ⧉ and **LAREX** ⧉ refer to.
